Credit Risk Dataset Overview

1. Dataset at a glance

Item	Observed in your file
File	credit_risk_dataset.csv
Rows / records	32,581 loan records
Columns	12 columns: 11 candidate input features and 1 target
ML task	Binary classification
Target	loan_status: 0 = non-default / no recorded default; 1 = default / recorded default, according to the dataset's standard coding
Class distribution	Class 0: 25473 (78.2%); Class 1: 7108 (21.8%)
Missing values	person_emp_length: 895; loan_int_rate: 3116; other columns: none

2. Role of every column

The descriptions below explain the likely meaning of each field based on its name and common usage in this credit-risk dataset. They are working definitions; confirm any business-specific definitions against the original dataset documentation.

Column	Meaning	Type	Potential modelling role
person_age	Applicant's age in years.	Numeric	May capture life-stage patterns, but inspect implausible values and consider fairness implications.
person_income	Applicant's reported annual income (currency units are not specified in the CSV).	Numeric	Potential indicator of repayment capacity; inspect extreme values and skew.
person_home_ownership	Applicant's housing status: RENT, MORTGAGE, OWN, or OTHER.	Categorical	May relate to financial stability or recurring housing costs; encode for modelling.
person_emp_length	Length of employment, usually measured in years.	Numeric; missing values	Can proxy employment stability. 895 values are missing; inspect unusual values before imputation.
loan_intent	Stated purpose of the loan, such as	Categorical	May reflect different borrowing needs and

	EDUCATION, MEDICAL, VENTURE, PERSONAL, DEBT CONSOLIDATION, or HOME IMPROVEMENT.		risk patterns; encode as a category.
loan_grade	Assigned loan grade, from A through G in this file.	Ordinal-like categorical	Likely summarizes a lender's assessment of risk. Check how and when it was assigned; it may encode information already used in underwriting.
loan_amnt	Amount of money requested or issued as the loan.	Numeric	Loan size may affect repayment burden; compare it with income and other variables.
loan_int_rate	Interest rate associated with the loan, stored as a numeric value.	Numeric; missing values	Affects borrowing cost and may reflect lender-assessed risk. 3116 values are missing; verify units and timing.
loan_status	Target label: 0 = non-default / no recorded default; 1 = default / recorded default.	Binary target	This is what the model predicts. Do not use it as an input feature.
loan_percent_income	Loan amount as a proportion of the applicant's income.	Numeric ratio	Measures loan burden relative to income. Check whether it is consistent with loan_amnt and person_income.
cb_person_default_on_file	Credit-bureau indicator for a previous default: N = no, Y = yes.	Categorical (binary)	Historical credit-risk signal. Check its definition and availability at prediction time.
cb_person_cred_hist_length	Length of the person's credit history, usually in years.	Numeric	Longer or shorter history may carry risk information; consider its relationship with age.
